

DELNIWA

Season: Early Season

Main characteristic/s: Primocane, Early, easy to pick, tolerant to main diseases, very sweet fruit

Breeder: NIWA Berry Breeding Ltd, Poland

Characteristics of Delniwa

- Early season fruiting
- Bright red, glossy fruit, lighter in colour than Polka, very sweet flavour
- Fruit is easily plucked and well presented to the pickers
- The canes of Delniwa are upright, light green with dense thorns
- Tolerant to the main raspberry pests & diseases

Cropping Season

Delniwa is an early season variety, the 50% pick dates ranging between 25 – 31st August compared to 6-8th September for 'Polana' in production in Poland over 2 years. The harvest is concentrated, plants planted in the tunnel in June reach the full harvest before first frosts in the first year after planting.

Fruit Quality

The berries are glossy, bright red colour, conical in shape and have a good-fair flavour. The berries don't darken after storage like 'Polka'. The average berry weight recorded over the whole season under tunnels in 2016 and 2017 was 5.0 g and 4.6 g respectively. The shelf life was good and in totally unsprayed plots no post-harvest fruit rots were observed. The soluble solid content (SSC) ranges between 9-11% Brix. Fruit Yield
Delniwa has good yield potential. The average yield per cane from plants planted in June under a tunnel was 0.8 kg.

Plant Characteristics

The canes of Delniwa are upright, light green with dense thorns. The average length of canes grown in the field is between 1.3-1.6 m. The fruit is produced on medium to long fruiting laterals in the top to half of the canes, is easily plucked and well presented to the pickers.

Disease Resistance

Delniwa is tolerant to the main raspberry pests & diseases.

Plant Supply

Delniwa is protected under Community (EU) Plant Variety Rights Application No. 2017/3320. The propagation and sale of plants, or parts of plants of Delniwa without a licence is prohibited.
